2005 Urban Water Management Plan
Contact Sheet

Date plan submitted to the Department of Water Resources: 12/29/2005

Name of person preparing this plan: Russell Fuller, General Manager
Phone: (661) 943-3201

Fax: (661) 943-3204

E-mail address: avekwa@aol.com

The Water supplier is a: State Water Project Contractor

The Water supplier is a: Wholesaler to potable water purveyors & Retailer of untreated agricultural water

Utility services provided by the water supplier include: Water

Is This Agency a Bureau of Reclamation Contractor? No
Section 1. Introduction

1.1 Purpose

The California Urban Water Planning Act requires urban water suppliers to describe and evaluate sources of water supply, efficient uses of water, demand management measures, implementation strategy and schedule, and other relevant information and programs. This information is used by the urban water supplier for development of an Urban Water Management Plan (UWMP) which is submitted to the California Department of Water Resources (DWR) every five years.
Section 2. Adoption and Implementation of Plans

2.1 Public Participation

The Antelope Valley-East Kern Water Agency (AVEK) has actively encouraged community participation in its urban water management planning efforts by encouraging attendance and participation in the Board of Directors (BOD) public meetings held twice each month. Public hearings were held on November 15, 2005 and December 20, 2005 for review of plan and to receive comments on the draft plan before the AVEK's BOD approval.

A special effort was made to include community and public interest organizations. Legal public notices for each meeting were published in the local newspapers and posted at Agency facilities. Copies of the draft plan were available at Agency office. See Appendix A for participation list.

2.1.1 Plan Adoption

AVEK prepared the initial draft of its Urban Water Management Plan during spring 2005. The final plan was adopted by the BOD on 12/20/2005 and submitted to the California Department of Water Resources within 30 days of BOD approval. Attached to the cover letter addressed to the Department of Water Resources and as Appendix B are copies of the signed Resolution of Plan Adoption. This plan includes all information necessary to meet the requirements of California Water Code Division 6, Part 2.6 (Urban Water Management Planning).
2.2 Agency Coordination

Law

10620 (d) (2) Each urban water supplier shall coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable.

10620 (f) An urban water supplier shall describe in the plan water management tools and options used by that entity that will maximize resources and minimize the need to import water from other regions.

10621 (a) Each urban water supplier shall update its plan at least once every five years on or before December 31, in years ending in five and zero.

10621 (b) Every urban water supplier required to prepare a plan pursuant to this part shall notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan.

2.2.1 Interagency Coordination

AVEK views “interagency coordination” in at least 2 ways, one with respect to the development of UWMP and the second concerns the development of additional water sources such as imported water stored in the groundwater basin. AVEK’s draft UWMP was posted on it’s website www.avek.org for public access and review. AVEK’s outreach efforts concerning this UWMP are outlined in Table 1.

With respect to the second issue, it should be recognized that AVEK is a supplier of imported water from the State Water Project (SWP) for the Antelope Valley region and that it is not a primary source but a secondary source. Since AVEK wholesales water to area retail purveyors, water sales volumes and predicted future treated and untreated water quantities are the only tools and products available for distribution. See Appendix C for Rate Stabilization fund discussion. The water provided by DWR through AVEK is used by area consumers in lieu of or in addition to pumped groundwater. The UWMP seeks to optimize water assets and plans for future water shortages. AVEK attempts to maximize use of its surface water product by encouraging retail purveyors to utilize surface water instead of pumped groundwater whenever possible and utilize groundwater recharge as a method for banking water during wet years. AVEK is reducing over drafting of the area aquifers by providing as much of its allocated DWR water to consumers as possible.

Currently, AVEK is actively involved with the planning stages and coordination of a fully regional water banking program. The proposed water banking program would function under a Joint Power Association format and treat all area-wide water interests equally by offering participation to all customers if desired. AVEK currently has a Water Supply Capacity Charge that funds system improvements that will be required for the anticipated growth of AVEK’s customers over the next 20 years. See Appendix D for list of proposed facility expansions. An improvement identified as a proposed facility expansion includes California Aqueduct turnouts, raw water pipelines and basin inlets that could be used for groundwater recharge.

To develop a successful groundwater banking and storage program, AVEK believes a myriad of issues concerning such a program (eg, legal, technical, financial, policy, etc.) should be addressed at the earliest possible stage by creating a comprehensive institutional framework for the program. Formulating such a framework should create as many stakeholders as possible. AVEK will encourage that appropriate steps be taken to facilitate discussions about this matter among stakeholders.
Finally, AVEK’s efforts to conserve and optimize its water resources have been the focus and will continue to be the focus on such programs as 1) provide treated and untreated surface water to area water retailers and farmers for a reasonable cost while maintaining their facilities and trained personnel; and 2) seek to institute programs and policies that deal with the water allocations during the inevitable dry years and spans of dry years. AVEK may assist, when possible, all area retailers in developing their own water conservation methods and policies as well as providing information about water conserving techniques.

2.2.2 Intra-Agency Coordination

Each year, the Agency considers the outlook on the water supplies for the Agency for the next 12 months. Figure 1, included in the UWMP, indicates AVEK’s DWR water deliveries under different availability conditions. Figure 1 includes information provided by the 2005 DWR State Water Project Delivery Reliability Report (draft 5/05) and indicates the probability that a given SWP Table A amount will be delivered from the Delta for current condition Study 6. Each line is constructed by ranking 73 annual Table A delivery values of Study 6 from lowest to highest and calculating the percentage of values equal to or greater than the delivery value of interest.
2.3 Supplier Service Area Information with 20 Year Projections

Law

10631. (a) Describe the service area of the supplier, including current and projected population, climate, and other demographic factors affecting the supplier's water management planning. The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier and shall be in five-year increments to 20 years or as far as data is available.

2.3.1 Demographic Factors

The Antelope Valley is located in the western part of the Mojave Desert, about 50 miles northeast of Los Angeles. The valley is triangular shaped, topographically closed basin covering about 2,200 square miles. Groundwater is an important component of water supply in the Antelope Valley (Leighton, USGS, 1999). Estimates of average natural annual groundwater recharge range from about 40,000 to 58,000 AFY (Snyder, 1955; Bloyd, 1967; Durbin, 1978). Pumping in the valley, primarily for agricultural purposes, peaked in the 1950's when production may have exceeded 400,000 AF annually (Snyder, 1955). Increased urban growth in the 1980's resulted in an increase in the demand for water and an increase in groundwater use. Long-term groundwater withdrawals have caused some land subsidence.

2.3.1.1 Service Area

AVEK has played a major role in the Valley's water system since it was granted a charter by the State legislature in 1969. It succeeded the AV-Feather River Association, which was formed in 1953 to encourage importation of water from the Feather River in northern California. See Appendix E for AVEK boundary map.

In 1962 the AVEK Board of Directors signed a water supply contract with the State Department of Water Resources (DWR) to assure delivery of imported water to supplement Antelope Valley groundwater supplies. AVEK has the third largest allotment of 29 State Water Project (SWP) water agencies in California, following the Metropolitan Water District and the Kern County Water Agency. See Appendix F for SWP map. SWP facilities are not fully constructed and until full built-out, SWP is capable of delivering annually about 72% of the project 4.1 million acre-feet.

Financed by a $71 million bond issue, AVEK constructed the Domestic Agricultural Water Network (DAWN), which consists of four water treatment plants with clear water storage and more than 100 miles of pipelines. Four 8-million gallon water storage reservoirs near Mojave and one 3-million gallon reservoir at Vincent Hill Summit complete the DAWN network. The bulk of the imported water is treated and distributed to customers throughout its service area. See Appendix G for current list of water purveyors that AVEK serves. The network also provides delivery of untreated water from the Aqueduct to local farmers and ranchers.

The Quartz Hill water treatment plant is capable of producing 65 million gallons per day (mgd) of treated aqueduct water. The Eastside water treatment plant is capable of producing 10 mgd. The Rosamond water treatment plant can produce 14 mgd while the most recently added treatment plant in Acton can make 4 mgd of treated water. Additional surface water allotments from the SWP exist in the area for Palmdale Water District and LittleRock Creek Irrigation District.

2.3.1.2 Population Projections

Lancaster and Palmdale are the largest cities in the Antelope Valley with Mojave, Edwards Air Force Base, Boron, and LittleRock being the larger of the fewer than 10,000 population centers.
AVEK provides service to incorporated and unincorporated areas of Antelope Valley. The population projections include inhabitants from Lancaster, Palmdale, Acton, and Lake Los Angeles of Los Angeles County and California City, Rosamond, Edwards Air Force Base, Mojave, and Boron of Kern County. Since AVEK only serves a portion of Palmdale, the projected values for Palmdale have been adjusted and then included in Table 2.

Table 2 indicates population growth projections within the service areas of AVEK. The projections are based on data from California Department of Finance and the Southern California Association of Governments. See Appendix H for information from these sources on projected growth.

2.3.2 Past Drought, Water Demand, and Conservation Information

During drought periods, the Agency has met most of its customers’ needs through special programs including turn back pool water, dry year water purchases, etc., and by utilizing larger reductions to agricultural users. AVEK has been unable to fulfill demands for SWP water only one time since its formation. See Appendix F for a list of the annual SWP water deliveries to AVEK.

Since 1995, the water demand for all water sources has increased by a growth rate of about 4% per year, due in part to a general acceleration in the region’s economy. From 1990 to 2000, the population within AVEK’s service area increased and new water demand has kept pace with the growth. The area continues to have a modest but growing industrial sector located principally in Palmdale and Lancaster. The commercial sector is increasing more rapidly due to increased numbers of consumers in the area and the general desire to shop closer to home. The agricultural economy is based on carrots, alfalfa, onions, peaches, pears, apple, vineyards and other stone type fruits becoming more common.
2.3.3 Climate

The area encompassed by AVEK is primarily desert. Vegetation is typical of the western Mojave Desert that includes creosote and desert shrubs. Certain portions of the valley contain large stands of Joshua Trees. Summer temperatures can reach 112°F while winter temperatures have been known to drop about 10°F. Typical annual average rainfall is 7 to 8 inches. The perimeter of the Antelope Valley includes low brush covered hills transitioning into the Tehachapi Mountains and San Gabriel Mountains to the west and south. The surface water runoff drainage channels and courses are active only during times of runoff due to precipitation. The water tables are well below the levels, needed to sustain year round flowing streams. The area is known for its daily winds, usually from the west. Table 3 illustrates average rates of evapotranspiration, temperature, and precipitation of the service area.

DWR’s Draft Water Plan includes an assessment of the impacts of global warming on the State’s water supply using a series of computer models and based on decades of scientific research. Model results indicate increased temperature, reduction in Sierra snow depth, early snow melt, and a raise in sea level. These changing hydrological conditions could affect future planning efforts which are typically based on historic conditions. Difficulties that may arise include:

- Hydrologic conditions, variability, and extremes that are different than current water systems were designed to manage
- Changes occurring too rapidly to allow sufficient time and information to permit managers to respond appropriately
- Requiring special efforts or plans to protect against surprises and uncertainties

As such, DWR will continue to provide updated results from these models as further research is conducted.
2.4 Water Supply Sources

Law

10631 (b) Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments [to 20 years or as far as data are available.]

2.4.1 Imported Water

AVEK sells imported water from the DWR California Aqueduct as part of the SWP. Currently, AVEK has an allocation for purchasing up to 141,400 acre-feet of water per year from the SWP.

2.4.2 Groundwater

AVEK does not have production groundwater wells and has no plans to include groundwater pumping as a water supply. In previous years, AVEK has made efforts to utilize groundwater to offset imported water deficiencies. These efforts were rejected by several of the larger AVEK purveyors and no further plans are in place for AVEK to use groundwater as a supply.

2.4.3 Recycled Water

AVEK does not provide recycled water. Reference is made to Section 7.1.1, AVEK’s Recycled Water Use Capabilities.

2.4.4 Current and Projected Water Supplies

Water supplies will have different historical dry year sequences and different yields during multiple year drought conditions based on hydrology, average storage, contract entitlements, etc. AVEK’s only source of water is SWP water.

</tr>
</tbody>
</table>

<sup>2</sup> Projected delivery percentages are based Study 6 & Study 7 of the DWR 2005 SWP Reliability Report (5/05 Draft). The average projected delivery percentage for year 2005 was taken from Table B-8 and for year 2025 the percentage was taken from Table B-9. Projected percentages for years 2010 – 2020 were derived by linearly escalating the percentage value of year 2005 to year 2025. See Appendix F.

<sup>3</sup> Projected Delivery is the product of the SWP Allocation of 141,400 AF/Y and the Projected Delivery Percentages provided by the DWR models. For example, in year 2010 the projected delivery of 100,394 AF/Y is the product of 141,400 AF/Y multiplied by the projected delivery percentage of 71%.
Section 3. Reliability Planning

Law

10631 (c) Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage, to the extent practicable and provide data for each of the following:

(1) An probable water year;
(2) A single dry water year; and,
(3) Multiple dry water years.

For any water source that may not be available at a consistent level of use, given specific legal, environmental, water quality, or climatic factors, describe plans to replace that source with alternative sources or water demand management measures, to the extent practicable.

3.1 Reliability

AVEK considers the usage of the word “reliability” in two connotations. First, the source reliability is only as reliable as the occurrences of the winter weather storms that deposit snow pack in the higher Sierra Nevada elevations that are part of the SWP watershed. Once the winter rain and snow season have been completed, the snow pack is measured and projected annual water volumes are given to SWP users. Prior to that, a specific volume of water is unpredictable. Based on previous experience, the predicted water values given by the State in the spring have been conservative.

The second step of “reliability” is what AVEK forecasts as the available water allocated for each of the water purveyors. AVEK also strives to be as informative as possible on the annual water allocations, and distributes information from the SWP projections to the water purveyors in a timely manner. The demand by water purveyors is greater in the summer months compared to the winter months. Utilizing water rates that are higher in peak months to offset water supply deficiencies is a demand management measure that is being used by AVEK.

Reliability planning requires information about: (1) the expected frequency and severity of shortages that occur because of reduction in SWP allocation and failure of transportation facilities; and (2) how available contingency measures can reduce the impact of shortages when they occur.

3.2 Frequency and Magnitude of Supply Deficiencies

The current and future supply projections through 2025 are shown in the above Table 4. The future supply projections assume normal inflows from the Sacramento Delta for the SWP. See Figure 1 for SWP delivery reliability.

According to SWP Delta Table A Delivery Reliability Probability for Year 2005, AVEK is projected to receive an average delivery of 69% of full Table A under current conditions. AVEK is projected to receive about 69% of full delivery at 69% of the time. The percentage of SWP Table A amounts projected to be available are referenced from Table B-8 of DWR’s “Excerpts from Working Draft of the 2005 State Water Project Delivery Reliability Report”, May 2005. AVEK has used the lowest allocation of 4% from Study 6, which includes revised current demands, for calculation of AVEK’s single dry year supplies. The multiple dry year demand was based on the 4-year drought values also presented in Table 6-5 title, “SWP Average and Dry Year Table A Delivery from Delta in Five-Year Intervals for Studies 6 and 7”. Based on the SWP
allotment for AVEK, a 69% of full delivery translates to about 97,566 acre-feet of water per year. For the remainder of this study, the value of 97,566 ac-ft will be defined as the baseline supply for a probable year.

### 3.3 Reliability Comparison

Table 5 details estimated water supply projections associated with several water supply reliability scenarios. The driest three-year historic sequence refers to the recorded three-year period with the lowest water deliveries that were available from DWR. For further information on the data, see Three-year Minimum Supply and Water Shortage Contingency Plan sections.

### 3.4 Factors Resulting in Inconsistency of Supply

The likeliest interruptions would be:

1. Reduction of annual SWP allocation due to low rainfall.
2. A result of loss of power or facility failure in the aqueduct.
3. Failure of Delta levee system.
4. Earthquake
5. Power loss

Response by the agency to any of the above factors will always include contact and coordination with AVEK's customers. Additionally, in the event of power loss AVEK has permanent emergency power generation that automatically starts to maintain water treatment operations. In the event of an earthquake, AVEK personnel will survey and assess damage and respond accordingly with shutdowns and repairs.

---

4 A probable water year scenario is defined as 69% of the full SWP allocation (141,400 ac-ft), or 97,566 ac-ft per historical reliability (Fig.1). This value coincides with the average percent of SWP allocation delivered as predicted in Table B-8 (Study 6) of the DWR 2005 SWP Delivery Reliability Report (5/05 Draft). The model assumes parties entitled to SWP water has adequate storage for capturing excess supplies during wet years. Actual volume of water available may be less if adequate storage is not available. Single and Multiple Dry Years data are cited from Table 6-5 (Study 6) of the DWR report.
3.5 Transfer or Exchange Opportunities

Law

10631 (d) Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.

3.5.1 Water Transfers

The Agency has in past explored and utilized dry year water transfer options to increase reliability. Additional water was acquired by AVEK in 2001; AVEK purchased 3,000 acre-feet of Table A water from Tulare Lake Irrigation District. It is estimated that additional water could be purchased by the Agency as emergency water supply if requested by water purveyors. Other sources of water available to AVEK include the turnback pool, Article 21, etc., that could be purchased if requested by customers or utilized for storage in the basin.

Law

10631 (e) (1) Quantify, to the extent records are available, past and current water use, over the same five-year increments described in subdivision (a), and projected water use, identifying the uses among water use sectors including, but not necessarily limited to, all of the following uses:

(A) Single-family residential; (B) Multifamily; (C) Commercial; (D) Industrial; (E) Institutional and governmental; (F) Landscape; (G) Sales to other agencies; (H) Saline water intrusion barriers, groundwater recharge, or conjunctive use, or any combination thereof;

(2) Agricultural.

(3) The water use projections shall be in the same 5-year increments to 20 years or as far as data is available.
4.1 Water Use by Customer Type – Past, Current, and Future

Table 7 details water purveyors deliveries for M&I. The future water uses shown in the tables were based on the SWP Delivery Reliability (Figure 1) for 69% of the time.

In case of rationing, the Agency will be able to utilize its customer database for implementing any possible water reductions.

4.1.1 Agricultural Sector

Agricultural water demand from AVEK’s system is projected to have minimal growth in the next ten to fifteen years with a possible decrease over the next twenty to thirty years. The water deliveries indicated in Table 8 show consistent amounts through 2025. Agricultural land use within the Agency’s area is currently increasing in quantity. Even so, it is projected that in the long term, more agricultural land will eventually be converted to urban uses.
Section 5. Demand Management Measures

Law

10631 (f) Provide a description of the supplier’s water demand management measures. This description shall include all of the following:
(1) A description of each water demand management measure that is currently being implemented, or scheduled for implementation, including the steps necessary to implement any proposed measures, including, but not limited to, all of the following: ...

AVEK is committed to implementing water conservation where applicable. This Section discusses water conservation.

For responding to the Urban Water Management Planning Act, the Agency will address the 14 Demand Management Measures. Descriptions of the Agency’s water conservation programs are below. The Agency has, in good faith, tried to address and comply with all of the BMP targets listed in the California Urban Water Conservation Council (CUWCC) Memorandum of Understanding (MOU) where applicable, even though the Agency is not signatory to the MOU regarding Urban Water Conservation or a member of CUWCC.

(A) DMM 1 – Water Survey Programs for Single-Family and Multi-Family Residential Customers

IMPLEMENTATION DESCRIPTION: All services of this type are provided by the water purveyor customers of AVEK. AVEK will assist in information research and dissemination when appropriate.

(B) DMM 2 – Residential Plumbing Retrofit

IMPLEMENTATION DESCRIPTION: All services of this type are provided by the water purveyor customers of AVEK. AVEK will assist in information research and dissemination when appropriate.

(C) DMM 3 – System Water Audits, Leak Detection and Repair

IMPLEMENTATION DESCRIPTION: AVEK has no formal leak detection or pipeline survey program. AVEK does however audit system losses monthly as part of it’s normal billing procedures. Pipelines are driven weekly as part of weekly water sample runs during which personnel will note leaks if observed. System losses of less than 3% of total deliveries are considered within the margin of error and normal. The agency repairs leaks promptly which averages about twice per year. Below is a table of results.

5 It should be recognized that Section 10620(c) of the Urban Water Management Planning Act provides that a water wholesaler need not address or implement certain planning elements described in the UWMP Act that are more applicable to water retailers (eg, water demand management measures).

12/20/2005
(D) DMM 4 – Metering with Commodity Rates

IMPLEMENTATION DESCRIPTION: The Agency charges all water purveyor customers based on metered readings and established rate schedules developed by the Agency. All current and new connections including temporary connections are required to be metered and billed per volume-of-use. AVEK has never operated unmetered connections. Additionally, existing meters are checked on a regular basis for leaks and accuracy.

(E) DMM 5 – Large Landscape Conservation Programs and Incentives

IMPLEMENTATION DESCRIPTION: Landscaping requirements and conservation incentives are provided by AVEK’s water purveyor customers and mandated by city and other governmental agencies.

(F) DMM 6 – High-efficiency washing machine rebate programs

IMPLEMENTATION DESCRIPTION: These programs are administered by water purveyor customers of AVEK. AVEK will disseminate information when appropriate.

(G) DMM 7 – Public Information Programs

IMPLEMENTATION DESCRIPTION: The Agency maintains an active public information program. The Agency promotes water conservation and other resource efficiencies in coordination with other utilities by distributing public information through brochures and through community speakers, paid advertising, and some special events every year. The Agency has been actively providing information to the public for over 20 years.

IMPLEMENTATION SCHEDULE: The Agency will continue to provide public information services and materials to remind the public about water and other resource issues.

METHODS TO EVALUATE EFFECTIVENESS: The Agency will solicit feedback from customer purveyors regarding the information provided.

CONSERVATION SAVINGS: AVEK has no method to quantify the savings of this DMM but believes that this program is in the public’s interest.

(H) DMM 8 – School Education Programs

IMPLEMENTATION DESCRIPTION: The Agency continues to work with school districts to promote water conservation and other resource efficiencies at school facilities and to educate students about these issues.

The Agency solicits advice from various local schools to help implement this program. AVEK provides educational materials to several grade levels, State and County water system maps, posters, workbooks, interactive computer software, videos, and tours (for example water treatment plants).

IMPLEMENTATION SCHEDULE: The Agency will continue to implement this DMM at the levels described.

METHODS TO EVALUATE EFFECTIVENESS: The Agency will continue to survey the institutions and educators on the number of programs, materials and attendance at water conservation activities.

CONSERVATION SAVINGS: The Agency has no method to quantify the savings of this DMM but believes that this program benefits the general public in their awareness of water conservation.
(I) DMM 9 – Conservation Programs for Commercial, Industrial, and Institutional Accounts

**IMPLEMENTATION DESCRIPTION:** These services are provided by AVEK’s water purveyor customers, and AVEK will disseminate information when appropriate.

(J) DMM 10 – Wholesale Agency Programs

**IMPLEMENTATION DESCRIPTION:** AVEK is a wholesale agency for water and the DMM's are identified and discussed in this section.

(K) DMM 11 – Conservation Pricing

IMPLEMENTATION DESCRIPTION: AVEK does not have a conservation pricing structure. AVEK maintains a standard pricing structure to all water purveyor customers regardless of water usage but does have water pricing structures that include variations in pricing based on time of year (winter versus summer). The winter versus summer pricing is to encourage use of AVEK imported water during the off-peak time of year instead of purveyors using groundwater. AVEK does not provide sewer service.

5.3 Development of Desalinated Water

Due to the agency’s distance from coastal areas, AVEK does not have the opportunity to implement a desalination program.
Section 6. Water Shortage Contingency Plan

Law

10632. The plan shall provide an urban water shortage contingency analysis which includes each of the following elements which are within the authority of the urban water supplier:

10632 (a) Stages of action to be undertaken by the urban water supplier in response to water supply shortages, including up to a 50 percent reduction in water supply and an outline of specific water supply conditions which are applicable to each stage.

6.1 Stages of Action

6.1.1 Rationing Stages and Reduction Goals

The Agency has developed delivery reduction goals to curb demand during water shortages. In the event of water supply shortages the Agency will make water delivery reductions per the Agency law for allocations. Reference is made to Appendix B, which includes the Resolution to Adopt a Water Shortage Contingency Plan.

<table>

1 Based on the years 1931, 1932, and 1933 as reported in Table 6-5 of the DWR 2005 SWP Delivery Reliability Report (Draft 5/05).
6.2 Preparation for Catastrophic Water Supply Interruption

Law

10632. The plan shall provide an urban water shortage contingency analysis which includes each of the following elements which are within the authority of the urban water supplier:

10632 (c) Actions to be undertaken by the urban water supplier to prepare for, and implement during, a catastrophic interruption of water supplies including, but not limited to, a regional power outage, an earthquake, or other disaster.

6.2.1 Water Shortage Emergency Response

Since the Agency began selling water to retailers, AVEK has maintained emergency contingency plans for activities required in the event there is an interruption in the DWR water supply or there is a major mechanical or electrical failure in one of the water treatment plants. The emergency activities that are undertaken by AVEK depend upon the severity of the problem and how quickly the problem can be remedied.

6.2.2 SWP Emergency Outage Scenarios

The Department of Water Resources has faced several potential outages along various parts of the SWP, mainly the California Aqueduct, since construction of the SWP in the early 1970s. Notable examples include slippage of side panels into the Aqueduct near Patterson in the mid-1990s, the Arroyo Passajero flood event in 1995 (which also destroyed part of Interstate 5 near Los Banos), and various subsidence repairs needed along the East Branch of the Aqueduct since the 1980s.

All of these outages were short-term in nature (on the order of weeks or months), and DWR's Operations and Maintenance Division worked diligently to devise methods to keep the Aqueduct in operation while repairs were made. Thus, the SWP contractors experienced no interruption in deliveries.

One of the great design engineering features of the State Water Project is the ability to isolate parts of the system. If one reservoir or portion of the Aqueduct (the Aqueduct is divided into "pools") is damaged in some way, other portions of the system can still remain in operation. Since September 11, 2001, DWR has made significant investments in the security measures protecting all SWP facilities. Security is now coordinated with the California Highway Patrol.

Events could transpire that could result in significant outages and potential interruption of service. Examples of possible nature-caused events include a levee breach in the Sacramento San Joaquin Delta near the Harvey O. Banks Pumping Plant; a flood or earthquake event that severely damaged the Aqueduct along its San Joaquin alley traverse, or an earthquake event along either the West or East Branches. Such events could impact all the SWP Contractors south of the Delta.

AVEK and other SWP Contractors response to such events would be highly dependent on where along the SWP an event occurred. Three scenarios are described herein that could impact AVEK's SWP deliveries. For these scenarios it is assumed that a 100 percent reduction for six months would result from these catastrophic events.
Scenario 1: Levee Breach near Banks Pumping Plant

As demonstrated by the June 2004 Jones Tract levee breach, the Delta’s levee system is extremely fragile. The SWP’s main pumping facilities are located in the southern Delta. Should a major levee in the Delta near these facilities fail catastrophically, salt water from the eastern portions of San Francisco Bay would rush into the Delta, displacing the fresh water runoff that supplies the SWP. All pumping would be disrupted until water quality conditions stabilized and returned to pre-breach conditions. The re-freshening of Delta water quality would require large amounts of additional Delta inflows, which might not be immediately available depending on the timing of the levee breach. The Jones Tract repairs took several weeks to accomplish and months to complete; a more severe breach could take much longer, during which time pumping might not be available on a regular basis.

Annual SWP operations consist of filling San Luis Reservoir, the major SWP storage facility south of the Delta, during the winter and spring months. South of Delta Contractors then take deliveries through San Luis Reservoir for the remainder of the year. Supplies are also stored in Pyramid and Castaic Lakes along the West Branch, as well as in a variety of groundwater banking programs in the southern San Joaquin Valley. Assuming that Banks Pumping Plant would be out of service for six months and that all southern Contractors had to take their supplies from the three reservoirs and from banking programs, coordination between DWR and Contractors would be required.

Scenario 2: Complete Disruption of the Aqueduct in the San Joaquin Valley

The 1995 flood event at Arroyo Pasajero demonstrated vulnerabilities of the Edmund G. “Pat” Brown portion of the California Aqueduct (that portion that traverses the San Joaquin Valley from San Luis Reservoir to Edmonston Pumping Plant). Should a similar flood event or an earthquake damage this portion of the aqueduct, deliveries from San Luis Reservoir could be interrupted for a period of time. DWR has informed the contractors that a four-month outage could be expected in such an event. AVEK’s assumption is a six-month outage.

Scenario 3: Complete Disruption of the Aqueduct East Branch

The East Branch of the California Aqueduct begins at a bifurcation of the Aqueduct in the Tehachapi Mountains south of Edmonston Pumping Plant. From the point of bifurcation, it is an open canal.

If a major earthquake (an event similar to or greater than the 1994 Northridge earthquake) were to damage a portion of the East Branch, deliveries could be interrupted. The exact location of such damage along the East Branch would be key to determining emergency operations by DWR and the southern California contractors. For this scenario, it is assumed that the East Branch suffered a single-location break and would not be available for deliveries.

If the shortage problem can be resolved within the available water storage time frame, only a few of the larger consumers need to be notified of the temporary decrease in water supply. If there will be a stoppage in the raw water deliveries to the various treatment plants, all customers (M&I and agriculture) will be notified of the stoppage and how soon water deliveries may be resumed.

If raw water deliveries to water treatment plants are temporarily stopped, treated water from other plants may be rerouted to the affected areas in some instances via interconnecting pipeline systems. Damages to the aqueduct will be repaired by DWR. Damaged Agency treatment plant components, whether mechanical or electrical, can usually be circumvented due to the duplicity of pumping and operations systems or the availability of manual over-ride controls. The magnitude of reduced water deliveries and length of time before resumption of full water availability will determine the extent of customer (M&I and agriculture) notification and activities required by the AVEK staff.
Possible Catastrophe:
- Power Outage
- Aqueduct Failure due to Earthquake or other circumstances
- Agency Treatment Plant Shutdown due to vital component failure
- Delta Levee Failure
- Local Earthquake

The following summarizes the actions the water agency will take during a water supply catastrophe.

Response by the agency to a catastrophic event will always include contact and coordination with AVEK’s customers. Additionally, in the event of power loss AVEK has permanent emergency power generation that automatically starts to maintain water treatment operations. In the event of an earthquake, AVEK personnel will survey and assess damage and respond accordingly with shutdowns and repairs.

6.3 Prohibitions, Consumption Reduction Methods and Penalties

Law

10632. The plan shall provide an urban water shortage contingency analysis which includes each of the following elements which are within the authority of the urban water supplier:

10632 (d) Additional, mandatory prohibitions against specific water use practices during water shortages, including, but not limited to, prohibiting the use of potable water for street cleaning.

10632 (e) Consumption reduction methods in the most restrictive stages. Each urban water supplier may use any type of consumption reduction methods in its water shortage contingency analysis that would reduce water use, are appropriate for its area, and have the ability to achieve a water use reduction consistent with up to a 50 percent reduction in water supply.

10632 (f) Penalties or charges for excessive use, where applicable.

6.3.1 Mandatory Prohibitions on Water Wasting

AVEK believes that their customers are in the best position to implement no-waste policies. AVEK can and will make recommendations to assist its customers in monitoring water wasting, if AVEK’s assistance is requested.

6.3.2 Excessive Use Penalties

Penalties for excessive use are imposed by water purveyor customers of AVEK. It is anticipated agricultural users will economize their water usage as required. AVEK has in place provisions for pre-paid ordering as a method of penalizing users who do not take the delivery requested. AVEK does not have powers to implement penalties for excessive use by a retailer’s customer but encourages all retailers to have such penalties in place.

6.3.3 Implementation

AVEK relies on its water retailers to implement water consumption reduction methods to their customers in order to cope water supply shortages.
6.4 Revenue and Expenditure Impacts and Measures to Overcome Impacts

Law

10632. The plan shall provide an urban water shortage contingency analysis which includes each of the following elements which are within the authority of the urban water supplier:

10632 (g) An analysis of the impacts of each of the actions and conditions described in subdivisions (a) to (f), inclusive, on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts, such as the development of reserves and rate adjustments.

Revenues collected by the Agency are currently used to fund operation and maintenance of the existing facilities and fund new capital improvements. The Agency will estimate projected ranges of water sales versus shortage situation to best understand the impact each level of shortage will have on projected revenues and expenditures.

Revenue reduction and an increase in expenditure may occur due to reduced sales from implementing the abovementioned programs. The magnitude of the revenue reduction and expenditure increase will be dependent on the severity of the water shortage, with larger and longer water shortages having greater impact on revenues. For minor events, the Agency may be able to absorb the revenue shortfall/increase in expenditures by reallocating existing funds, such as delaying some capital projects. For large events, the Agency may enact a rate adjustment to its customers.
6.5 Shortage Contingency Ordinance/Resolution

Law

10632. The plan shall provide an urban water shortage contingency analysis which includes each of the following elements which are within the authority of the urban water supplier:

10632 (h) A draft water shortage contingency resolution

6.5.1 AVEK Water Shortage Response/Priority by Use

AVEK has a plan of action in its existing rules and regulations in the event it is necessary to declare a water shortage emergency. AVEK reserves the right at any time if the quantity of water available to the Agency pursuant to the Water Supply Contract between the DWR and AVEK is less than the aggregate of all consumer requests to allocate the quantity of water available to AVEK to the extent permitted by law. See Appendix B for Resolution to Adopt a Water Shortage Contingency Plan.

6.5.2 Health and Safety Requirements

These requirements will be left to the retailing water purveyor agencies. AVEK has no direct control of the final water user actions and activities.

6.5.3 Water Shortage and Triggering Mechanisms

AVEK will attempt to provide the minimum health and safety water needs of the service area. It must be recognized that AVEK’s water supply is not considered a primary source of water and it is a secondary source of water. The water shortage response plan was designed based on the assumption that during a long term drought DWR will have a reduction in water deliveries.

Rationing stages may be triggered by a shortage in the DWR water source. Although an actual shortage may occur at any time during the year, a shortage (if one occurs) is usually forecasted by the Water Department on or about April 1 each year. If it appears that it may be a dry year and the water supplies will be reduced, AVEK contacts its agricultural customers in March with confirmation follow up in April, so that the customers can minimize potential financial impacts.

The Agency’s sole water source is imported surface water. Rationing stages may be triggered by a supply shortage or by contamination.
6.6 Reduction Measuring Mechanism

Law

10632. The plan shall provide an urban water shortage contingency analysis which includes each of the following elements which are within the authority of the urban water supplier:

10632 (i) A mechanism for determining actual reductions in water use pursuant to the urban water shortage contingency analysis.

6.6.1 Mechanism to Determine Reductions in Water Use

Under non-emergency water supply conditions, potable water production figures are recorded daily. Totals are reported daily to the Water Treatment Facility Supervisor. Totals are reported monthly to the Board of Directors and incorporated into the water supply report.

During water shortage periods, the Agency will review daily the water demands versus the established reduction goals. Reference is made to Appendix B, Resolution to Adopt Water Storage Contingency Plan. The Agency will take appropriate steps to reduce their deliveries to meet the reduction goals.
Section 7. Recycled Water Plan

Law

10633. The plan shall provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. To the extent practicable, the preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies and shall include all of the following:

10633 (a) A description of the wastewater collection and treatment systems in the supplier's service area, including quantification of the amount of wastewater collected and treated methods of wastewater disposal.

10633 (b) A description of the recycled water currently being used in the supplier's service area, including but not limited to, the type, place and quantity of use.

10633 (c) A description and quantification of the potential uses of recycled water, including, but not limited to, agricultural irrigation, landscape irrigation, wildlife habitat enhancement, wetlands, industrial reuse, groundwater recharge, and other appropriate uses, and a determination with regard to the technical and economic feasibility of serving those uses.

7.1 Wastewater Quantity, Quality, and Current Uses

7.1.1 AVEK's Recycled Water Use Capabilities

AVEK does not collect or treat wastewater and has no plan to use recycled water as part of their deliveries. The Agency provides service to retail and water purveyors and agricultural customers that may have the opportunity to utilize recycled water as part of deliveries. The Agency supports the use of customers' plans that would utilize recycled water within AVEK boundaries. The use of recycled water by AVEK customers is an important part of reducing the demand on AVEK's available water. Los Angeles County Water Works District has estimates for the future availability and location of recycled water and they are included in Appendix I.
7.2 Potential and Projected Use, Optimization Plan with Incentives

Law

10633 (d) A description and quantification of the potential uses of recycled water, ..., and a determination with regard to the technical and economic feasibility of serving those uses.

10633. (e) The projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision.

10633 (f) A description of actions, including financial incentives, which may be taken to encourage the use of recycled water, and the projected results of these actions in terms of acre-feet of recycled water used per year.

10633 (g) A plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacle to achieving that increased use.

7.2.1 AVEK's Recycled Water Use Philosophy

AVEK does not collect or treat wastewater and has no plan to use recycled water as part of their deliveries. AVEK's customers should investigate, develop, and implement recycled water usage programs. The Agency encourages the use of recycled water. For example, AVEK is presently assisting the City of Lancaster with funding for a recycled water project by extending the timing for repayment of an existing loan.
Section 8. Water Quality Impacts on Reliability

Law

10634. The plan shall include information, to the extent practicable, relating to the quality of existing sources of water available to the supplier over the same five-year increments as described in subdivision (a) of Section 10631, and the manner in which water quality affects water management strategies and supply reliability.

The agency water supply is solely provided by the State Water Project, and its water quality is maintained and governed by the standards established by the Department of Water Resources. As such, the Agency does not expect fluctuation in the water quality that will affect agency water management strategies. See Appendix I for the DWR Sanitary Survey Update Report 2001 information and DWR website for State Water Project water quality information.
Section 9. Water Service Reliability

Law

10635 (a) Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and multiple dry water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from the state, regional, or local agency population projections within the service area of the urban water supplier.

9.1 Projected Water Supply and Demand

The following compares current and projected water supply and demand. This information is based on continued commitment to conservation programs, conjunctive use programs and use of groundwater and recycled water, by the water purveyors. Probable supply totals for the year 2005 are based on the Agency receiving 69% of its delivery amount from the State Water Project, 69% of the time, which is about 97,566 acre-feet of water per year. The projection gradually increases to 77% or 108,878 acre-feet of water per year by 2025. These projections are shown in Table 10. The 2005 and 2025 projections are based on data provided in Table 6-7 listed as the ‘average percent delivery from 1922-1994’ under Study 6 (Revised Demand Today) and Study 7 (Revised Demand Future), respectively, of the DWR SWP Delivery Reliability Report (May 05, Draft). The projected probable 5-year water supply for the other years are derived from a linear escalation of the 2005 supply totals up to the 2025 supply totals.

Active water efficiency improvements and additional water supply will be necessary to meet the Agency’s projected water demand. The Agency will continue to examine supply enhancement options, such as groundwater recharge for Antelope Valley and conjunctive water use as discussed in Section 2.2.1, Intergency Coordination.

Projected demand totals are calculated based on population growth projection shown in Table 2. It was assumed that a household of 3.5 people requires 1.2 acre-foot of water per year. The assumed water usage rates are based on demand history for single-family dwellings in the area. New housing construction and related landscaping in the area does not appear to be different from existing housing development. The following tables will show water demand projection based on population projections from Table 2.

</tbody>
</table>

The comparison of the projected probable year supply and demand indicates a shortfall starting in the year 2006. This comparison is based on current usage patterns by the retail purveyors and agriculture users. The short fall in supply does not take into account the reliability of other sources available to water purveyors, such as their use of groundwater, future groundwater banking programs, future conservation efforts, and use of recycled water.

### 9.2 Projected Single Dry Year Supply and Demand Comparison

The 2005 and 2025 projected single dry water year percentages were based on the minimum delivery by the delta as reported in Table B-8 (Study 6) and Table B-9 (Study 7) respectively of the DWR SWP Delivery Reliability Report (May 05, Draft). The projected single dry water year percentages for the other years are derived from a linear escalation of the 2005 supply totals up to the 2025 supply totals.

---

6 Projected five-year water demand is for all water sources available in the area.

7 The projected probable demand by agriculture is only an estimate of their demand since a record of their groundwater usage is not available.
The comparison of the projected probable year supply and demand indicates a shortfall starting in the year 2006. This comparison is based on current usage patterns by the retail purveyors and agriculture users. The short fall in supply does not take into account the reliability of other sources available to water purveyors, such as their use of groundwater, future groundwater banking programs, future conservation efforts, and use of recycled water.

In any dry year, the Agency will notify its customers of the potential water shortage for the year.

It is up to the purveying customers of AVEK to direct rationing program and policies to consumers. Therefore, expected changes to demand due to dry years will be provided by the purveying customers.
9.3 Projected Multiple Dry Year Supply and Demand Comparison

The following tables identify the projected minimum water supply based on the four-year drought historic sequence for water supply as presented in Table 6-5 of the DWR 2005 SWP Delivery Reliability Report (Draft May 05).

</tbody>
</table>

This comparison is based on current usage patterns by the retail purveyors and agriculture users. The short fall in supply does not take into account the reliability of other sources available to water purveyors, such as their use of groundwater, future groundwater banking programs, future conservation efforts, and use of recycled water.

It is up to the purveying customers of AVEK to direct rationing program and policies to their consumers. Therefore, expected changes to demand due to dry years will be provided by the purveying customers. The development and use of other water sources, such as groundwater, conjunctive uses, the use of recycled water, and the storage of Article 21 water when available, are essential measures necessary to meet long-term demands.

### 9.3.1 Three Year Minimum Water Supply Alert

Based on experiences during reductions of State Water Project water, AVEK recognizes that it is better to enter into a water shortage alert early, to establish necessary programs and policies, to gain public support and participation, and to reduce the likelihood of more severe shortage levels later. Improved water use efficiency does mean that water supply reserves must be larger since water use efficiency improvements will be minimal. Water shortage responses must be made early to prevent severe economic and environmental impacts.

In May of each year, the Agency forecasts the minimum water supply availability for its water, and projects its total water supply for the current and three subsequent years. Based on the water shortage, a water shortage condition may be declared. Because shortages can have serious economic and environmental impacts, the Agency will make every effort to provide accurate predictions of water shortages.

Re: AVEK 2005 URBAN WATER MANAGEMENT PLAN PUBLIC REVIEW DRAFT

The Antelope Valley-East Kern Water Agency 2005 Urban Water Management Plan will be ready for review on December 10, 2005. The plan will be posted on the Agency’s website (www.avek.org). The AVEK Board of Directors will be conducting a public hearing on the plan on Tuesday, December 20, 2005, at 7:00 p.m. in the Agency’s Board Room.

Please provide any written comments to the Agency by 5:00 p.m. December 20, 2005. Comments should be directed to:

Antelope Valley-East Kern Water Agency

APPENDIX B

- RESOLUTION TO ADOPT THE URBAN WATER MANAGEMENT PLAN
- RESOLUTION TO ADOPT WATER SHORTAGE CONTINGENCY PLAN
ANTELOPE VALLEY-EAST KERN WATER AGENCY

RESOLUTION NO. R-05-34
TO ADOPT THE URBAN WATER MANAGEMENT PLAN

The Board of Directors of the Antelope Valley-East Kern Water Agency ("AVEK") do hereby resolve as follows:

I. RECITALS

WHEREAS, the Antelope Valley-East Kern Water Agency was formed in 1959 by an act of the State Legislature. AVEK's powers, duties, authorities and other matters are set forth in its enabling act, which is codified at California Water Code, Uncodified Acts, Act 9095 (the "AVEK Enabling Act"); and

WHEREAS, AVEK's jurisdictional boundaries cover portions of three counties, Los Angeles, Ventura County and Kern County, and is more particularly described in Appendix E in the 2005 Urban Water Management Plan ("AVEK's Jurisdictional Boundaries"); and

WHEREAS, AVEK was formed for the purpose of providing water received from the State Water Project ("SWP") as a supplemental source of water to retail water purveyors and other water interests within AVEK's Jurisdictional Boundaries on a wholesale basis; and

WHEREAS, in order to effectuate the above-referenced purpose, AVEK, among other things, entered into a contract with the Department of Water Resources ("DWR"), which operates the SWP, in order for AVEK to receive water from the SWP ("SWP Water"); and

WHEREAS, AVEK has entered into contracts with various retail purveyors and other water interests in AVEK's Jurisdictional Boundaries that govern AVEK's delivery of SWP Water to those purveyors and other water interests (the "AVEK's Water Supply Contracts"). Article 19 in those contracts provide that "substantial uniformity" in those contracts is "desirable" and that AVEK will "attempt to maintain such uniformity" between such contracts; and

WHEREAS, AVEK does not provide SWP Water directly to any person or entity for domestic or municipal purposes; and
WHEREAS, AVEK does not own or operate any facilities that can produce reclaimed water or native groundwater from any area in AVEK’s Jurisdictional Boundaries, and neither does AVEK possess any contractual right or matured water right to produce such waters; and

WHEREAS, the Urban Water Management Planning Act, California Water Code Section 10610 et seq. ("UWMP Act"), mandates that every supplier providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre feet of water annually, prepare an Urban Water Management Plan; and

WHEREAS, the UWMP Act further provides that such plans shall be periodically reviewed and updated by the supplier once every five years no later than December 31st of each calendar year ending in zero and five; and

WHEREAS, AVEK has circulated drafts of its proposed 2005 Urban Water Management Plan ("2005 UWMP") to the public for review and comment; and

WHEREAS, AVEK’s Board of Directors ("AVEK Board") held duly noticed public hearings on its proposed 2005 UWMP on November 15, 2005 and December 20, 2005; and

WHEREAS, the AVEK Board received and considered written and verbal testimony and evidence from the public and others concerning its proposed 2005 UWMP; and

WHEREAS, AVEK retained technical and legal consultants to provide expert assistance concerning its 2005 UWMP; and

WHEREAS, AVEK has adopted Resolution No. 05-________ that adopts a water shortage contingency plan.

II.
FINDINGS

THEREFORE, AVEK finds as follows:

1. AVEK’s 2005 UWMP complies with all applicable laws and regulations, including but not limited to the UWMP Act, the AVEK Enabling Act, and the Guidebook To Assist Water Suppliers in the Preparation of a 2005 Urban Water Management Plan issued by the DWR and dated as of January 18, 2005.
2. AVEK’s 2005 UWMP is consistent with the intent and terms of the AVEK’s Water Supply Agreements.

3. The AVEK Board’s adoption of the 2005 UWMP is supported by substantial evidence, which evidence is contained in the administrative record received by the AVEK Board for this matter.

4. Each of the recitals contained in this Resolution is approved as a finding of fact.

III.
ADOPTION OF 2005 UWMP

THEREFORE, be it resolved and ordained by the AVEK Board as follows:

1. The 2005 UWMP is approved and adopted. The President of the AVEK Board authorized and directed to file the 2005 UWMP with the entities specified in the UWMP Act by the dates specified therein.

ADOPTED this 20 day of December, 2005, by the following vote:

AYES: 6    NOES: 0    ABSENT: 1    ABSTAIN: 0

ATTEST: ________________________________
Agency Secretary

Approved as to Form and Legality: ________________________________
AVEK Special Counsel
ANTELOPE VALLEY-EAST KERN WATER AGENCY

RESOLUTION NO. 05-33
TO ADOPT A WATER SHORTAGE CONTINGENCY PLAN

The Board of Directors of the Antelope Valley-East Kern Water Agency ("AVEK") do hereby resolve as follows:

I. RECITALS

WHEREAS, the Antelope Valley-East Kern Water Agency was formed in 1959 by an act of the State Legislature. AVEK's powers, duties, authorities and other matters are set forth in its enabling act, which is codified at California Water Code, Uncondified Acts, Act 9095 (the "AVEK Enabling Act"); and

WHEREAS, AVEK's jurisdictional boundaries cover portions of three counties, Los Angeles, Ventura County and Kern County, and is more particularly described in Appendix E in the 2005 Urban Water Management Plan ("AVEK's Jurisdictional Boundaries"); and

WHEREAS, AVEK was formed for the purpose of providing water received from the State Water Project ("SWP") as a supplemental source of water to retail water purveyors and other water interests within AVEK's Jurisdictional Boundaries on a wholesale basis; and

WHEREAS, in order to effectuate the above-referenced purpose, AVEK, among other things, entered into a contract with the Department of Water Resources ("DWR"), which operates the SWP, in order for AVEK to receive water from the SWP ("SWP Water"); and

WHEREAS, AVEK has entered into contracts with various retail purveyors and other water interests in AVEK's Jurisdictional Boundaries that govern AVEK's delivery of SWP Water to those purveyors and other water interests (the "AVEK's Water Supply Contracts"). Article 19 in those contracts provide that "substantial uniformity" in those contracts is "desirable" and that AVEK will "attempt to maintain such uniformity" between such contracts; and

WHEREAS, AVEK does not provide SWP Water directly to any person or entity for domestic or municipal purposes; and

WHEREAS, AVEK does not own or operate any facilities that can produce reclaimed water or native groundwater from any area in AVEK's Jurisdictional Boundaries, and neither does AVEK possess any contractual right or matured water right to produce such waters; and

WHEREAS, the Urban Water Management Planning Act, California Water Code Section 10610 et seq. ("UWMP Act") provides that urban water management plans shall include a resolution or ordinance by the supplier that sets forth a water shortage contingency plan; and

WHEREAS, Section 61.1 of the AVEK Enabling Act sets forth guiding principles for AVEK's distribution of SWP Water, which principles can be drawn upon in allocating such water in times of shortage (the provisions of Section 61.1 of the AVEK Enabling Act are set forth in Exhibit A to this Resolution); and

WHEREAS, real property related taxes have been paid to AVEK since 1959 by entities in AVEK's Jurisdictional Boundaries.

WHEREAS, AVEK has circulated drafts of its proposed 2005 UWMP and the water shortage contingency plan set forth in this Resolution ("WSC Plan") to the public for review and comment; and
WHEREAS, AVEK's Board of Directors ("AVEK Board") held duly noticed public hearings on its proposed 2005 UWMP on November 15, 2005 and December 20, 2005 and a public meeting on the WSC Plan on December 20, 2005; and

WHEREAS, the AVEK Board received written and verbal testimony and evidence from the public and others concerning its proposed 2005 UWMP and WSC Plan.

II. FINDINGS

THEREFORE, AVEK finds as follows:

1. AVEK finds that there is a need to adopt a water shortage contingency plan given, among other things, the requirements of the UWMP Act and the potential that the amount of SWP Water made available to AVEK by DWR may not satisfy the demands for SWP Water by AVEK's customers (even though such demand for SWP Water has only exceeded the available supply of SWP Water once since AVEK was formed).

2. The WSC Plan complies with all applicable laws and regulations, including but not limited to the UWMP Act, the AVEK Enabling Act, and the Guidebook to Assist Water Suppliers in the Preparation of a 2005 Urban Water Management Plan issued by the DWR and dated as of January 18, 2005.

3. AVEK finds that the WSC Plan is fair and equitable.

4. The WSC Plan is consistent with the intent and terms of the AVEK's Water Supply Agreements and the AVEK Enabling Act.

5. Each of the recitals contained in this Resolution is approved as a finding of fact.

III. ADOPTION OF WATER SHORTAGE CONTINGENCY PLAN

THEREFORE, be it resolved and ordained by the AVEK Board as follows:

1. AVEK adopts a WSC Plan that would be implemented when the aggregate amount of SWP Water reasonably ordered by AVEK's customers in any water year exceeds the amount of SWP Water that DWR makes available to AVEK on that same water year (a "SWP Water Shortage Year"). When that contingency occurs (which contingency will be deemed to occur under both stages listed in Appendix 1 hereto), AVEK plans to allocate that amount of available SWP Water as follows:

(a) The available SWP Water shall first be allocated per each county (the "County Allocation of SWP Water") in AVEK's Jurisdictional Boundaries based on a running historical average of the amount of taxes paid to AVEK by entities in each particular county since the formation of AVEK in 1959. (Attached as Exhibit B to this Resolution is the historical amount of such taxes paid by county through June 30, 2005.) AVEK shall annually update and publish that running historical average of taxes paid to AVEK by county.

(b) Each County's Allocation of SWP Water shall be further allocated to each AVEK customer within that particular county based on its average annual percentage of SWP Water received in the two water years prior to the SWP Water Shortage Year relative to the amount of SWP Water received by all other AVEK customers in that particular county in those two prior water years. (For illustrative purposes, attached as Exhibit C to this Resolution is a list of such relative percentages by AVEK customers by county for 2004.)

(c) In determining the amount of SWP Water that should be delivered by AVEK to any customer in any SWP Water Shortage Year, AVEK will fill orders for SWP Water that will be used by the AVEK customer(s) for consumptive or agricultural uses in that same water year prior to filling any order for SWP Water that would be used by an AVEK customer for banking or storage purposes.

(d) AVEK reserves the right to allocate SWP Water that it receives from DWR in a SWP Water Shortage Year in a manner that differs from the provisions of this WSC Plan based on a finding by the AVEK Board of unique or unusual circumstances or needs.
EXHIBIT A

§ 61.1 Distribution and apportionment of water purchased from State, etc.

The agency shall whenever practicable, distribute and apportion the water purchased from the State of California or water obtained from any other source as equitably as possible on the basis of total payment by a district or geographical area within the agency regardless of its present status, of taxes, in relation that such payment bears to the total taxes and assessments collected from all other areas.

It is the intent of this section to assure each area or district its fair share of water based upon the amounts paid into the agency, as they bear relation to the total amount collected by the agency.
## EXHIBIT B

APPENDIX C

RATE STABILIZATION FUND DISCUSSION

The Agency uses as its rate stabilization fund the Agency's reserve fund to stabilize rates during periods of water shortages or disasters affecting water supply.
## Appendix D

### WATER SUPPLY CAPACITY CHARGE IMPROVEMENTS

**Proposed Expansions**

- Eastside WTP (10 mgd to 25 mgd)
- QHWTP (Phase I – 9 MG reservoirs)
- QHWTP (Phase II – second 9 MG reservoirs)
- Acton WTP (4 mgd to 8 mgd)
- Rosamond WTP (4 mgd to 8 mgd)
- Westside Water Treatment Plant #1 (15 mgd)
- Westside Water Treatment Plant #2 (3 mgd)
- East Feeder/South Feeder – Interconnect Pipeline
- East Feeder/South Feeder – Interconnect Pump Station
- Mojave Pump Station Addition
- South Feeder Parallel Pipeline (Phase II)
- QHWTP/Westside WTP #1 – Interconnect Pipeline
- QHWTP/Westside WTP #2 – Interconnect Pump Station
- Westside WTP I Feeder Pipeline
- West WTP I Feeder Pump Station
- East Feeder Parallel Pipeline
- Lake Hughes Feeder Parallel Pipeline
- Lake Hughes Feeder Pump Station
- Leona Valley Feeder Parallel Pipeline
- Leona Valley Feeder Pump Station
- QHWTP/RWTP Intercon. Pipeline
- QHWTP/RWTP Intercon. Pump Station
- Area Raw Water Turnouts, Pipelines and Basin Inlets
- North Feeder Pump Station
- QHWTP (65 mgd to 90 mgd and ozone)

**Abbreviation Legend**

QH = Quartz Hill, R = Rosamond, WTP = Water Treatment Plant

ASSUMPTIONS FOR POPULATION GROWTH PROJECTIONS

The population growth projections encompass water purveyors located in areas currently served by AVEK primarily around the Antelope Valley and portions of eastern Kern County. This includes the City of Lancaster, portions of the City of Palmdale, various communities in Kern County, and two unincorporated areas in Los Angeles County. Communities in Kern County include the cities of Mojave, Boron, Edwards, and Rosamond, and the Edwards Air Force Base. Unincorporated communities in Los Angeles County include Acton and Lake LA area.

The base population shown in this report is taken from years 1990 and 2000 census data provided by California Department of Finance (DoF). Documentation can be retrieved at the following web link - http://www.dof.ca.gov/HTML/DEMOGRAP/CALHIST2a.XLS.

Lancaster:
Population growth projections were based on the average growth rate of Palmdale from 2000 to 2020 as reported by Southern California Association of Government (SCAG) Documentation can be retrieved at their website - http://www.scag.ca.gov/forecast/downloads/2004GF.xls.

Palmdale:
Population growth projection provided by SCAG. Documentation can be retrieved at their website - http://www.scag.ca.gov/forecast/downloads/2004GF.xls. Since AVEK boundaries encompasses approximately 50% of the City of Palmdale, only 50% of the projected population have been included in the tables and figures of this report.

Kern County:
Data for population growth projections are also provided by the DoF. Documentation for the projections can be retrieved at their website at - www.dof.ca.gov/HTML/DEMOGRAP/DRU_Publications/Projections/P3/KERN.XLS. The DoF projections did not separate the cities mentioned above with the remaining cities in Kern County. Therefore, population growth data was extrapolated using year 2000 census data of the areas served by AVEK and the projected Kern county growth rates from this DoF document. The population from this area accounts for approximately 11%-15% of the total population served by AVEK.

Los Angeles County:
Data for population growth projections are provided by SCAG. Documentation for the projections can be retrieved at their website at - http://www.scag.ca.gov/forecast/downloads/2004GF.xls. The SCAG projections did not separate the areas served by AVEK with the remaining unincorporated cities in Los Angeles County. Therefore, population growth data was extrapolated using year 2000 census data and the projected growth rate of 'Unincorporated LA County' as provided in the SCAG growth projection document. The population from this area accounts for approximately 6%-7% of the total population base served by AVEK.
Appendix I

- EXCERPT FROM LOS ANGELES COUNTY WATERWORKS DISTRICT RECYCLED WATER SUPPLY ASSESSMENT
- SANITARY SURVEY UPDATE REPORT 2001
- WATER QUALITY WEBSITE INFORMATION
2.3 Recycled Water Supplies

Another source of water that is available to the Antelope Valley but is not yet being utilized by the Study Area is recycled water. District No. 40 is currently leading an effort to develop a Recycled Water Facilities Plan for the Antelope Valley. This Facilities Plan recommends a backbone recycled water system to serve the Study Area.

2.3.1 Source Characteristics

Lancaster Water Reclamation Plant (LWRP), Palmdale Water Reclamation Plant (PWRP) and Rosemont Wastewater Treatment Plant (RWWTP) are three wastewater treatment plants in the Study Area. These three plants primarily provide secondary treated effluent. Currently, the only recycled water in the Study Area that is treated to a tertiary level is a small percentage of the wastewater at the LWRP through additional onsite facilities known as the Antelope Valley Tertiary Treatment Plant (AVTTP). Effluent management is challenging in Antelope Valley because the area is a closed basin with no river or other outlet to the Pacific Ocean. Effluent management options are restricted to methods such as reuse, evaporation, and percolation. LWRP, PWRP and RWWTP will all provide tertiary treated effluent with future upgrades. A description of each of the three treatment plants that may provide recycled water to the Study Area is provided below.

2.3.1.1 Lancaster Water Reclamation Plant (LWRP)

The LWRP, built in 1959 and located north of the City of Lancaster, is owned, operated, and maintained by the Los Angeles County Sanitation District No. 14 (District No. 14). LWRP, which has a permitted capacity of 16.0 mgd, treated an average flow of 13.3 mgd in 2004 to secondary standards for use agricultural irrigation, wildlife habitat, and recreation. Additionally, 0.6 mgd is currently treated to tertiary standards and used for landscape irrigation at the Apollo Lakes Regional County Park.

District No. 14 plans to upgrade the existing LWRP for a total capacity of 21 mgd by 2008 with a proposed future upgrade to 26 mgd by 2014. Tertiary treated effluent from the upgraded LWRP will be available for municipal reuse in addition to the existing uses.

2.3.1.2 Palmdale Water Reclamation Plant (PWRP)

PWRP, built in 1963 and located on two sites adjacent to the City of Palmdale, is owned, operated, and maintained by the Los Angeles County Sanitation District No. 20 (District No. 20). PWRP, which has a permitted capacity of 15.0 mgd, treated an average flow of 8.4 mgd in 2004 to secondary standards for land application or agricultural irrigation.

A recent revision to the Waste Discharge Requirements due to concerns of nitrate in the groundwater, requires District No. 20 to eliminate their existing practice of land application and agricultural irrigation above agronomic rates of treated effluent by October 15, 2008. By November 15, 2009, District No. 20 is required to prevent the discharge of nitrogenous compounds to the groundwater at levels that create a condition of pollution or violate the water quality objectives identified in the 1994 Water Quality Control Plan for the Lahontan Region (1994 Basin Plan). In response, the treatment capacity of the PWRP will be increased to 22.4 mgd and tertiary treatment added. Tertiary treated water is anticipated to be fully used for municipal purposes.
2.3.1.3 Rosamond Wastewater Treatment Plant (RWWTP)

RWWTP, located in the City of Rosamond, is owned, operated, and maintained by the RCSD. RWWTP, which has a permitted capacity of 1.3 mgd, treated an average flow of 1.1 mgd to undisinfected secondary standards for landscape irrigation on-site.

RCSD plans to increase the capacity to 1.8 mgd in 2010 through the addition of 0.5 mgd tertiary treatment facility. The tertiary treatment facility will then be upgraded to 1.0 mgd in 2018.

Design for the proposed treatment plant improvements is complete and has been approved by the State of California. Construction is currently delayed due to lack of funding. Once constructed, the plant would provide tertiary treated recycled water for landscape irrigation at median strips, parks, schools, senior complexes and new home developments.

2.3.2 Availability of Supply

For the purpose of this study, wastewater flow projections are being used to define the amount of recycled water available to the Study Area. These projections were determined from the Draft Facilities Plan and are for tertiary treated water only. They also consider recycled water that has already been contracted out to users outside of the Study Area. Table 2-7 provides a summary of the recycled water flow projections for the Study Area through 2030. The flow projections for LWRP and PWRP in 2005 include secondary treated effluent because the tertiary treatment plant upgrades are not yet constructed.

Notes:
(a) Obtained from the Lancaster Water Reclamation Plant 2020 Facilities Plan, prepared by the Sanitation Districts of Los Angeles County, May 2004, less the 3.03 mgd already committed to contract.
(c) Obtained from documentation and phone calls provided by RCSD in May 2005 and a RCSD fax received in August 2005.

Although Table 2-7 provides the volumes of recycled water available, actual use of recycled water is limited to demand. Table 2-8 provides the projections of recycled water demand for the Study Area assuming 100 percent delivery of Table A and existing groundwater pumping rates. The projections are based on a recycled water market assessment and are generally for agricultural irrigation, landscape irrigation, and wildlife habitat. Due to delays in funding, RCSD has yet to determine their recycled water demand or identify any recycled water users. Thus, for purposes of this report, a conservative estimate of zero demand was assumed. District No. 40 recycled water demands were determined from the addition of the City of Lancaster and City of Palmdale demands from the Facilities Plan. Use of recycled water would be encouraged through the use of financial incentives (i.e., recycled water would be available at a lower cost than the existing potable water supply).

2.3.3 Water Quality

The current and projected water quality of the treated wastewater at LWRP, PWRP and RWWT that will be used for recycled water purposes is expected to meet tertiary treated standards as defined in California Water Code Title 22 regulations. Furthermore, the use of recycled water would allow for more potable water to available with the same water quality as...

Acknowledgments

The Sanitary Survey Action Committee (SSAC) provided project oversight, logistical support, and manuscript review for the 2001 Sanitary Survey Update. A work team consisting of members of the SSAC and California Department of Health Services worked with Department of Water Resources staff to refine the original work plan for the update, and to address issues that arose during its writing and production. While the majority of the draft report was reviewed by the SSAC, this report is a DWR product and does not necessarily reflect the viewpoint of individual committee members or the member's organization.

The Department of Water Resources appreciates the SSAC's input and support in the development of the 2001 Sanitary Survey Update.

Introduction and Background

1.1 Purpose of the Watershed Sanitary Survey Update

The California Department of Health Services (DHS), under California Surface Water Treatment regulations, requires that all water purveyors perform a sanitary survey of their water source watersheds and update it every 5 years. These regulations implement the federal Surface Water Treatment Rule (SWTR), which became effective on 31 December 1990.

The purpose of a watershed sanitary survey is to:

- Describe control and management practices,
- Describe potential contaminant sources or activities (PC5s) and their effect on drinking water source quality,
- Determine if appropriate treatment is provided, and
- Identify actions and recommendations to improve or control contaminant sources.

1.2 History of the SWP Sanitary Survey Update 2001

After completion of the initial State Water Project (SWP) Sanitary Survey in 1980, a SWP Sanitary Survey Action Committee (SSAC) was formed. It consisted of staff from the California Department of Water Resources (DWR) and DHS’s Drinking Water Program, representatives of the State Water Contractors and consultants. The SSAC’s role was to follow up on the report’s recommendations. The SSAC’s work resulted in the State Water Project Action Plan. This action committee has continued to meet over the years, and although individual membership has changed, the SSAC’s makeup has remained the same.

The SSAC has taken on the task of providing guidance for the 3-year updates of the Sanitary Survey. The Sanitary Survey Update Report 1996 focused on changes in SWP watersheds and water quality since 1980. The update also provided information on site visits to watersheds—Del Valls, San Luis, Pyramid, Castiar, Silverwood, Ferris, Barker Slough/North Bay Aqueduct watershed, and the open channel section of Coastal Aqueduct. An emphasis was placed on the occurrence of coliforms and the pathogenic Giardia and cryptosporidium. The Update 1996, completed in May 1996, included the results of an extensive database search on toxic sites within SWP watersheds.

1.3 Coordination with Stakeholders

Preparation for the Sanitary Survey Update Report 2001 began July 1999 with SSAC meetings to discuss and develop a work plan and scope of work. The SSAC approved a draft work plan and schedule in September 1999 and adopted the final work plan in December 1999.

In May 2000, SSAC members with specific expertise and/or access volunteered to work as a subgroup to expedite the information retrieval, evaluation, and feedback process for the 2001 update. Those named members represented DHS, SWP contractors, Metropolitan Water District of Southern California (MWDSC), Santa Clara Valley Water District (SCVWD), DWR’s Operations and Maintenance Division (O&M), and the California Urban Water Agencies (CUWA).

Following work plan development, DWR’s Municipal Water Quality Investigations (MWQI) management and staff, DHS staff, and the SSAC established agreements to help ensure adequate progress, the attainment of necessary infermations, and feedback on document content quality.

In conjunction with the agreements, this group—SSAC subgroup, MWQI and DHS staff—held frequent and focused meetings and conference calls.
to track progress, discuss schedules and resource issues, and prioritize tasks.

DHS granted a schedule extension, which was requested because of staffing resource issues and difficulty in obtaining available information. The original delivery date of January 2001 for the final review draft was eventually changed to 4 May 2001. Because of this constraint, not all chapters were reviewed by the SSAC prior to the release of the final review draft. The SSAC, DHS, and DWR staff conducted a thorough review of the final review draft chapters, and after a review of the comments, the document was revised to achieve technical accuracy and consistent formatting.

1.4 2001 Sanitary Survey Assessment Approach

Sanitary Survey Update Report 2001 offers detailed evaluations of study areas and issues that were selected based on actions and recommendations from previous reports and concerns stemming from new data and information. Findings and recommendations in Update 1995 led to extensive studies of the Bear Creek watershed and pathogens in surface water. Each of these follow-up activities is covered in detail in its own chapter.

The SSAC work plan specified that Sanitary Survey Update 2001 would rely on existing data and information from DWR, MWDHS, and other agencies and would require extensive coordination and cooperation to obtain relevant information from several Federal, State, and local sources.

During work plan development, it was agreed to provide information in Sanitary Survey Update 2001 to make it useful for SWP utilities in complying with the California Existing Water Source Assessment and Protection (DW/SAP) Program. The relationship of the Sanitary Survey Update 2001 to the DW/SAP Program is discussed in section 1.5. Sanitary Survey Update 2001 is not required by the DW/SAP Program, but much of its PCS information is readily available for incorporation into the source water assessment as required by the DW/SAP Program.

A key task in the work plan was the preparation of a sanitary survey questionnaire and its distribution to SWP contractors. This approach was also used for the Sanitary Survey Update 1996. The questionnaire was used to obtain information in the most efficient and direct way possible on contaminant sources, available data, and major water quality issues. Of the 29 contractors, 12 responded to the questionnaire (several contractors were not using SWP water at the time).

1.5 Scope of Work for Each SWP Watershed

During the development process for Sanitary Survey Update 2001, DWR stated that new field reconnaissance surveys and additional sampling studies would not be performed specifically for the update. The exception was a 2-year study of the Bear Creek watershed because Sanitary Survey Update 1995 recommended an investigation.

The major Sanitary Survey Update 2001 tasks performed for each watershed study include:

- Review and evaluation of the results from the questionnaire sent to SWP contractors.
- Personal communication with staff of various agencies and review of pertinent reports and data about major water quality issues.
- Determination and mapping of each source watershed area.
- Evaluation of areas and contaminants of known or suspected concern, as directed by DHS and the SSAC:
  - Development of inventories of PCSs and activities in each area.
  - Determination of the susceptibility of the water supplies of each area to these contaminant sources and activities.
- Reports and summaries of the results, identification and rating of significant PCSs, and development of recommended actions to reduce the susceptibility of water supplies to existing and future water quality problems.

1.6 Selection and Evaluation of Potential Contaminant Sources

The general type of PCSs used in the Sanitary Survey Update 2001 were developed with SSAC input and the California Water Resources Association Guidance Manual. They are presented below:

- Recreation
- Wastewater treatment facilities (includes treatment plants, sewerage treatment, transport, treatment, disposal, and sludge systems)
- Urban runoff
- Animal populations (includes grazing, dairies, and wild animal populations)
- Algal blooms
- Agricultural activities (includes agricultural crop and livestock use, pesticides and herbicides use, and agricultural drainage)
- Mining
- Solid or hazardous waste disposal facilities
- Logging
1.7 REPORT ORGANIZATION

1.7.1 CHAPTER PRESENTATION

The Sanitary Survey Update 2001 watershed chapters are organized by geographical areas, such as the 4 Southern California reservoirs, or by spatial connection, such as the 5 sections of the California Aqueduct. Figure 1-1 shows the approximate geographical location of the watersheds covered in the chapters and their corresponding sections of the SWP. The following SWP reservoirs and corresponding watersheds are covered in Sanitary Survey Update 2001:

- SWP reservoirs
  - Pyramid Lake
  - Castaic Lake
  - Silverwood Lake
  - Lake Perris
  - San Luis Reservoir
  - Lake Del Valle

- SWP aqueducts:
  - North Bay Aqueduct (Barker Slough watershed)
  - South Bay Aqueduct
  - California Aqueduct sections:
    - H. H. Banks Pumping Plant to O'Neill Reservoir (Check 13)
    - O'Neill Reservoir
    - O'Neill Reservoir to Awapuhi
    - Awapuhi to Kern River Intake
      (Check 23)
      - Kern River Intake to East/West Interchange (Check 41)
      - Coastal Branch
      - East Branch and West Branch
  - Harvey O. Banks Delta Pumping Plant
  - The Sacramento-San Joaquin Delta and watershed of the Sacramento and San Joaquin rivers
At the beginning of each watershed section, a summary matrix shows the assessed threats to the water supply system. The matrix also shows the PCIs assigned. Each section of this chapter presents the following information:

- Descriptions of land use, geology and soils, vegetation, and hydrology of each watershed area or descriptions of the SWP aqueduct branches for the water supply system areas.
- Identification of PCIs for each area.
- Summary of water quality data.
- Discussion of the significance of the PCIs to each area.
- Watershed management practices.

Including this introductory chapter, 5 chapters do not focus on a particular watershed. Chapter 2 summarizes current laws and regulations for drinking water. Chapter 11 describes the SWP Sanitary Survey System and related information. Chapter 12 presents and discusses pathogen data, which DHS and the SSAC considered necessary to include in this report. Chapter 13 contains conclusions and recommendations for the PCIs and water quality issues presented in chapters 3 through 10.

1.7.2 SIGNIFICANCE MATRICES

Significance matrices provide a new approach for the SWP Sanitary Survey System. Each significant watershed begins with a matrix, which operates as a "road map" by providing a quick assessment of the most important PCIs and directing the reader to corresponding chapter sections. The matrices are not absolute ratings of importance. A chapter should be read completely to gain a full understanding of the potential threats to drinking water quality. Each PCI that threatens drinking water contamination of a water supply system was rated as follows:

- PCS is a highly significant threat to drinking water quality
- PCS is a medium threat to drinking water quality
- PCS is a potential threat, but available information is inadequate to rate the threat.
- PCS is a minor threat to drinking water quality

In each matrix, symbols represent ratings, and numbers stand for the chapter sections in which the PCI is discussed. The ratings were based on data and information collected during research for Sanitary Survey Update 2001. Some data provided a clear connection between the PCI and its potential to contaminate drinking water. Some information was anecdotal and based on the collective knowledge and experience of the author investigating a source, as well as that of SSU staff and staff of the DWR Water Quality Assessment Branch. In some cases, where a PCI was a close source of the contamination, but the linkage at a threat was unclear, the PCI was given a medium rating. Sometimes a PCI was a close source of the contamination, but evidence and data indicated the source was not a threat to drinking water. In these cases, the PCI received a minor threat rating, for example, pesticides in the Delta watershed.

Chapter numbers for PCIs are taken from a master list approved by the SSAC work team in fall 1999. The list had to be verified and expanded because of the work involved in geographical use and ratings for each chapter.

1.7.3 DEVELOPMENT OF CONCLUSIONS AND RECOMMENDATIONS

Conclusions and recommendations in chapter 13 were developed at 3 workshops where SSAC and other staff reviewers and discussion leaders discussed drafts and provided substantive input and revision. Detail of the process and content is provided in the introduction to chapter 13. It must be emphasized that chapter 13 is not a "stand-alone" chapter, that each chapter must be reviewed to obtain a complete picture of the status of a particular watershed. Only significant PCIs were included in chapter 13's conclusions and recommendations.

1.8 RELATIONSHIP WITH DWSAP

Under the 1995 authorization of the Safe Drinking Water Act (SDWA), all states must complete a source water assessment (SWA) for public water systems by 2003. A SWA document is prepared to determine the presence of PCIs, to determine the appropriate monitoring needed, to inform the public, and to assist in the development of watershed protection programs. The DWSAP Program presents a set of standardized procedures for conducting a SWA. The DWSAP allows watershed sanitary surveys, like the Sanitary Survey Update Report 2001, as alternative methods of determining a water source's vulnerability.
While its requirements are similar, Sanitary Survey Update Report 2001 contains more information than a SWA. Because of the vast size of the SWP, many subwatersheds interconnect with it. The key tasks of developing this sanitary survey consisted of separate assessments for each of the subwatersheds selected for inclusion. The DWWSAP Program assessment and vulnerability summary of sources that are part of the SWP may be based on the information contained in this Sanitary Survey Update.

DHS will use the Sanitary Survey Update Report 2001 as the basis of the DWWSAP Program's source water assessment for SWP facilities and for the preparation of vulnerability summaries for these facilities. DHS will work with contractors and water utilities to complete the SWAs. Water utilities then will be required to include information about the assessments and vulnerability summary language in their Consumer Confidence Reports (Walker personal communication).

There are 6 information requirements that SWP contractors will be required to supply for their DWWSAP Program assessments. Contractors will prepare their own DWWSAP Program assessments for DHS, based on Sanitary Survey Update 2001 information, to include the following:

1) Location of Supply Source.
2) Definition of Source Areas and/or Protection Zones—Watershed will be designated as the source area/protection zone. This sanitary survey will provide the detailed information on the watershed, to each contractor's SWA can refer to the 2001 Sanitary Survey Update Report.
3) Evaluation of Physical Barrier Effectiveness—DHS will provide standard language for this.
4) Inventory of Possible Contaminating Activities—This is identified in the 2001 Sanitary Survey Update Report. Water contractors can refer to the update and provide limited description in DWWSAP Program document.
5) Vulnerability Ranking—After review of raw water quality data provided by DWK and the water contractors, a consistent approach for such contractors to use in assessing vulnerability will be developed.
6) Assessment Map—2001 Sanitary Survey Update Report contains maps of watershed showing major land uses, pipelines, etc.
Water Quality

- Water Quality
  - State Water Project Water Quality - Division of Operations and Maintenance
    The State Water Project water quality program collects detailed information on concentrations and distribution of chemical, physical, and biological parameters at more than thirty sites in the California Aqueduct and associated reservoirs.
  - Municipal Water Quality - Division of Environmental Services
    Site includes publications, program resources, projects and data related to drinking water quality.
  - Office of Water Quality - Division of Environmental Services
    Meet the overall water quality needs of DWR and to provide a central focal point for the collection and dissemination of water quality information.
  - Bay-Delta Health and Program Development - State Water Project
    Analysis Office
    Includes water rights hearings information, workshops, and Environmental Impact Reports.
  - South Delta Improvement Project (SDIP) - Bay-Delta Office
    The SDIP works to incrementally maximize diversion capability into Clifton Court Forebay, while providing an adequate water supply for diversions within the SDWA, and reducing the effects of State Water Project exports on both aquatic resources and direct fish losses in the South Delta.
  - North Delta Improvement Project (NDIP) - Bay-Delta Office
    The NDIP works to implement flood control improvements in a manner that benefits aquatic and terrestrial habitats, to the extent practicable.
  - Northern District Water Quality - Division of Planning and Local Assistance
    Water bodies are assessed for water quality characteristics, risks to beneficial uses, and effects of watershed management.
  - Central District Water Quality - Division of Planning and Local Assistance
    Assists local agencies and watershed groups with the collection, analysis, and storage of water quality data from rivers, streams, lakes, and reservoirs throughout its district boundaries.
  - San Joaquin District Water Quality - Division of Planning and Local Assistance
    Provide assistance and technical advice to local water agencies and to the general public on water quality conditions and on water quality standards.
  - Southern District Water Quality - Division of Planning and Local Assistance
    Technical assessments are conducted that provide unique and consistent information on the status, trends, and causes of groundwater and surface water quality conditions.
  - Southern Field Division Water Quality Programs - Division of Operations and Maintenance

APPENDIX I
Water Quality

Monitors the water quality of its four Southern California reservoirs to provide its State Water Project contractors with the most current reservoir conditions.

- **Water Data Library** - Division of Planning and Local Assistance
  Grab sample water quality data collected by DWR.
- **California Data Exchange Center (CDEC)** - Division of Flood Management
  Real-time decision support system to DWR Flood Management and other flood emergency response organizations, providing operational and historical hydrologic and meteorologic data, forecasts, and reports.
- **San Joaquin River Real-time Program** - Division of Planning and Local Assistance
  The real-time Water Quality Management Program uses telemetered stream stage, salinity data and computer models to simulate and forecast water quality conditions along the lower San Joaquin River.

- Land & Water Use
- Ecosystem/Watershed Restoration
- Sacramento-San Joaquin Delta
- Drainage
- Environmental Analysis & Review
- Ecological Studies
- Environmental Compliance & Evaluation
- Environmental Documentation
- Invasive Species
